Iron Vacu-vials® Kit

K-6003: 0 - 6.00 ppm (Prog. # 100)
K-6203: 0 - 6.00 ppm (Prog. # 100 or 103)

Instrument Set-up

For CHEMetrics photometers, follow the Setup and Measurement Procedures in the operator’s manual. For spectrophotometers, set the wavelength to 505 nm. A sealed ZERO ampoule is supplied in this kit for zeroing when the sample is colorless and not turbid. For improved accuracy with colored or turbid samples, Sample Zeroing Accessory Pack, Cat. # A-0503 is recommended. Using the sample cup, snap the tip of the A-0503 ampoule in the sample (see figure 2 below). Invert the ampoule to mix. Dry the ampoule and use it in place of the supplied ZERO ampoule to zero the instrument.

Soluble Iron Procedure: K-6003

Ferrous Iron Procedure: K-6203

1. Fill the sample cup to the 25 mL mark with the sample to be tested (fig 1).
2. Place the Vacu-vial ampoule, tip first, into the sample cup. Snap the tip. The ampoule will fill leaving a bubble for mixing (fig 2).
3. To mix the ampoule, invert it several times, allowing the bubble to travel from end to end.
4. Dry the ampoule. Obtain a test result 1 minute after snapping tip.
5. Insert the Vacu-vial ampoule into the photometer, flat end first, and obtain a reading in ppm (mg/Liter) iron (Fe).

NOTE: If using a spectrophotometer that is not pre-calibrated for CHEMetrics products, then use the equation below or the Concentration Calculator found under the Support tab at www.chemetrics.com.

\[ \text{ppm} = 6.35 \times (\text{abs}) - 0.03 \]

Total Iron Procedure

1. Fill the sample cup to the 25 mL mark with the sample to be tested.
3. After 4 minutes, stir the sample once again and then perform the Soluble/Ferrous Iron Procedure using this pretreated sample.

Test Method

The Iron Vacu-vials® test kit employs the phenanthroline chemistry. Ferrous iron reacts with 1,10-phenanthroline to form an orange colored complex in direct proportion to the ferrous or soluble iron concentration. Total iron is determined by adding a mixture of thioglycolic acid and ammonia to the sample. This mixture dissolves most forms of particulate iron.

Various metals will produce high test results. Certain forms of very insoluble iron (magnetite, ferrite, etc.) require the following digestion procedure in place of the Total Iron test procedure:

a. Fill a heat-resistant, glass container to 25 mL with the sample to be tested.
b. Add 5 drops of A-6000 Solution. Stir briefly.
c. Gently boil the sample to reduce volume to 10-15 mL.
d. Cool the sample and dilute to 25 mL with iron-free water.
e. Perform the Soluble/Ferrous Iron Procedure using this pretreated sample.

Safety Information

Read SDS (available at www.chemetrics.com) before performing this test procedure. Wear safety glasses and protective gloves.
