

Nitrate - Cadmium Reduction Method

Version 7 / Jun 2023

Applications and Industries

Industrial wastewater influent and effluent, industrial process waters, boiler water, cooling water, surface and ground water, potable water

Not applicable for analysis of seawater

Chemistry

Nitrate is reduced to nitrite with cadmium. In an acidic solution, the nitrite diazotizes with a primary aromatic amine and then couples with another organic molecule to produce a highly colored azo dye. The resulting pink-orange color is proportional to the nitrate concentration. Results are expressed as ppm (mg/L) NO₃-N or NO₃. To convert results from ppm NO₃-N to ppm NO₃, multiply by 4.43.

Available Analysis Systems

Visual colorimetric: CHEMets®

Instrumental colorimetric: Vacu-vials®

Storage Requirements

Products should be stored in the dark at room temperature.

Shelf Life

When stored in the dark and at room temperature:

Visual colorimetric:

CHEMets refills, color comparators: at least 1 year

Instrumental colorimetric:

Vacu-vials kits: at least 1 year

Safety Information

Safety Data Sheets (SDS) are available upon request and at www.chemetrics.com. Read SDS before using these products. Breaking the tip of an ampoule in air rather than water may cause the glass ampoule to shatter. Wear safety glasses and protective gloves.

Interference Information

- These sample constituents will decrease the efficiency of the cadmium reduction step, causing low test results:
 - Iron, copper and other metals
 - oil and grease
 - high levels of chloride
 - high levels of chlorine and other halogens
 - sample turbidity

Interferences from some metals may be minimized by treatment of the sample with EDTA solution. Turbid samples can be filtered prior to analysis.

- Nitrite interferes by reading positively with the test and by decreasing the efficiency of the cadmium reduction step. Test results will be biased high when nitrite is present at detectable levels.
- Alkalinity up to 1500 ppm CaCO₃ is tolerated.
- Thiosulfate causes low test results.
- Some fertilizers may produce a pale orange color with the reagent.
- Sample pH should be between 5 and 9 for most efficient cadmium reduction.
- Low test results are obtained with seawater.

Accuracy Statement

Statements of accuracy are based on laboratory tests performed under ideal testing conditions using standards of known concentration prepared in deionized water.

Visual colorimetric:

CHEMets kits: ± 1 color standard increment

Instrumental colorimetric

Vacu-vials kit, K-6903:

≤ 0.12 ppm at 0 ppm NO₃-N
± 0.12 ppm at 0.40 ppm NO₃-N
± 0.33 ppm at 1.10 ppm NO₃-N

Vacu-vials kit, K-6923:

≤ 0.60 ppm at 0 ppm NO₃-N
± 0.60 ppm at 2.00 ppm NO₃-N
± 1.65 ppm at 5.50 ppm NO₃-N

Vacu-vials kit, K-6933:

≤ 3.8 ppm at 0 ppm NO₃
± 3.8 ppm at 12.5 ppm NO₃
± 11.3 ppm at 37.5 ppm NO₃
